INFO1005 – Website Design

UX Testing Summary

Project: Web Design Portfolio

Project: Web Design Portfolio

Student: Minh Nguyen

ID: 22222222

1. Introduction

User Experience (UX) testing was conducted to evaluate the usability, functionality and overall presentation of my digital design portfolio website. The purpose was to ensure that visitors could navigate the website easily, access information and interact with its features without unnecessary difficulties.

2. Testing Areas

The website was reviewed across the following areas:

- **Navigation:** Checked the navigation menu and confirmed that links direct visitors to the correct sections, including About, Skills, Experience, Testimonials, Projects, Contact and Evidence.
- **Responsive design:** Reviewed the responsive layout created using Bootstrap 5 and CSS media queries. The layout is designed to adapt to different screen sizes, with content stacking on smaller screens and displaying in columns on larger screens.
- **Interactive elements:** Checked the project carousel, portfolio buttons, project information modals and Evidence and Reflection accordion.
- **Images and content:** Reviewed image display, text readability, section organisation and consistency throughout the website.
- **Contact and résumé:** Checked the contact links and résumé access to ensure visitors can find relevant professional information.

3. Testing Results

The website's main navigation and interactive components were functioning as intended during the review. Navigation links directed visitors to their corresponding sections, while the carousel, project buttons, modals and accordion provided the expected interactions.

The content was organised into clearly defined sections, allowing visitors to browse information about my background, skills, experience and creative projects. The consistent use of typography, colours, spacing and visual elements helped maintain a unified appearance.

The responsive Bootstrap grid and CSS media queries were incorporated to support different screen sizes and improve accessibility across devices.

4. Improvements Made

Following the website review, several refinements were made to improve usability and presentation:

- Reorganised the navigation menu to create a clearer browsing sequence.
- Added Testimonials to the navigation menu for easier access.
- Improved the Evidence and Reflection content and its accordion structure.
- Refined portfolio project information and interactive presentation.
- Adjusted section layout and spacing to create a more consistent visual experience.

5. Conclusion

Overall, the UX review helped confirm that the portfolio provides a clear and functional browsing experience. The website combines responsive design, organised content and interactive Bootstrap components to present my creative and technical work.

Future improvements could include gathering feedback from additional users, conducting more detailed accessibility testing and expanding the portfolio with further original projects.
